

Nintendo Switch OLED *released on Oct 8, 2021*

The Nintendo Switch is a video game console developed by Nintendo and released worldwide on March 3, 2017. It can be used either docked as a home console or portable device. Its wireless Joy-Con controllers can be attached to both sides of the console to support handheld-style play. In addition, its game library is irresistible, with some of the most successful gaming franchises of all time: Pokemon, Mario Kart, Mario Party, Link and Zelda... Since its release, it has been proven to be a stellar success for Nintendo, selling over 85 million units after just 49 months on the market, making it the fastest-selling console of all time.

In October 2021, Nintendo has released an upgrade of the Nintendo Switch: Nintendo Switch OLED

Nintendo Switch OLED: specs

- Size: 4-inch (H) x 9.5 inch (L) x 0.55-inch deep
- Weight: 322g
- Screen: 7-inch 1280 x 720p OLED multi-touch capacitive touch screen
- CPU/GPU: Custom Nvidia Tegra processor
- Storage: 64GB (expandable up to 2TB Micro SD)
- Battery life: 4.5-9 hours

The biggest difference between the old version of Nintendo Switch and its new successor Nintendo Switch OLED is the screen. The 7-inch OLED screen, compared to the 6-inch LCD screen on the base Switch, the larger screen provides crisp images with vibrant colors and deep blacks, the color richness has improved significantly. The Nintendo Switch OLED also provides better speakers with a clearer, more nuanced soundscape, even at lower volumes.

Many people argue that the newer upgraded version of the base Nintendo Switch, The Nintendo Switch OLED, provides little to no improvements to the original model, however with a price increase of only \$50, the player can enjoy a much better screen to better immerse into the gameplay.
